

1. **You are negatively charged and stand above a negatively charged plate. Which direction does the electric force on you point?**
  - A. Toward the plate
  - B. Away from the plate**
  - C. Parallel to the plate
  - D. There is no force
  
2. **You are standing above a positively charged plate. You change your charge from positive to negative. What happens to the direction of the electric force on you?**
  - A. It stays the same
  - B. It reverses direction**
  - C. The force becomes zero
  - D. The force becomes perpendicular to the plate
  
3. **A positively charged object is placed near a negatively charged object. What happens?**
  - A. They attract each other**
  - B. They repel each other
  - C. Neither object experiences a force
  - D. They experience forces in the same direction
  
4. **Two charged objects are moved farther apart. What happens to the electric force between them?**
  - A. It increases
  - B. It decreases**
  - C. It stays the same
  - D. It becomes zero immediately
  
5. **If the distance between two point charges is doubled, what happens to the electric force between them?**
  - A. It becomes twice as large
  - B. It becomes half as large
  - C. It becomes one-quarter as large**
  - D. It becomes four times as large
  
6. **If the magnitude (strength) of one of two charged objects is increased while the distance between them stays the same, what happens to the electric force?**
  - A. It increases**

- B. It decreases
- C. It stays the same
- D. It becomes zero

7. **A positively charged object is placed between two identical positively charged objects. The two surrounding charges push on it with equal forces in opposite directions. What is the net electric force on the object?**

- A. To the left
- B. To the right
- C. Zero
- D. It depends only on the object's charge

8. **Two positively charged plates produce electric fields pointing to the right at the same location. What is the direction of the net electric field?**

- A. Left
- B. Right
- C. Up
- D. Zero

9. **A neutral particle is placed in an electric field. Assuming it has no other forces acting on it, what electric force does it experience?**

- A. A force in the direction of the field
- B. A force opposite the field
- C. A force perpendicular to the field
- D. No electric force

10. **Which type of field can exert a force on a charged particle even when the particle is stationary?**

- A. Electric field
- B. Magnetic field
- C. Both
- D. Neither

11. **A magnetic field can exert a force on a charged particle only when the particle is moving.**

(T/F)

12. **A positively charged particle is moving out of the screen. It enters a magnetic field pointing upward. In which direction does the magnetic force act?**

A. Left

B. Right

C. Up

D. Down
